

CONVERSION_RATE Business Analysis Report

Anomaly date: 2026-08-09 | Generated: 2026-09-02 14:16

Executive Summary

The selected KPI was analyzed for 2026-08-09. The strongest identified driver was **doraemon**, which changed by -82.89% relative to the comparison baseline. Overall analysis confidence is **low**.

Profitability Snapshot

Metric	Value
Revenue	\$1858.00
Cost	\$844.17
Net Profit	\$1013.83
Status	Profit

Root Cause Analysis

Factor	Type	Current	Baseline	% Change	Contribution
doraemon	product	39.0000	228.0000	-82.89%	118.4%
shinchan	product	90.0000	387.6900	-76.79%	186.4%
mrbean	product	315.0000	193.8500	62.50%	-75.9%
pokemon	product	1029.0000	637.0000	61.54%	-245.5%
dragonballz	product	385.0000	571.1500	-32.59%	116.6%
conversion_rate	kpi_factor	0.0246	0.0359	-31.51%	N/A
aov	kpi_factor	88.4800	95.0277	-6.89%	N/A

Product-Level Revenue Drivers

Product	Revenue Today	Baseline	% Change	Contribution	Volume Effect	Price Effect
doraemon	\$39.00	\$228.00	-82.89%	118.4%	\$-189.00	\$0.00
shinchan	\$90.00	\$387.69	-76.79%	186.4%	\$-297.69	\$0.00
mrbean	\$315.00	\$193.85	62.50%	-75.9%	\$121.15	\$0.00
pokemon	\$1029.00	\$637.00	61.54%	-245.5%	\$392.00	\$0.00
dragonballz	\$385.00	\$571.15	-32.59%	116.6%	\$-186.15	\$0.00

Confidence

Level: low

Score: 0.30

Abstain: True

Reason: Only 13 historical days are available, but 14 days are needed for a reliable comparison. More historical data is recommended before assigning a primary cause.

Other Affected KPIs

No other KPI anomalies were identified.

KPI Trend and Anomaly

AI Business Narrative

Marketing Manager

What changed on 2026-08-09?

- Total revenue fell to \$1,858 from the baseline average of about \$2,400.
- The four products that showed the biggest drops were **doraemon** and **shinchan**. Their sales volumes dropped by 82.9 % and 76.8 %, respectively, contributing roughly 120 % and 186 % of the overall revenue decline (negative contribution percentages are shown because the drops outweigh the gains from other items).
- Two other products, **mrbean** and **pokemon**, actually increased in volume (62.5 % and 61.5 % respectively), but their increases were not large enough to offset the drops from the top two.
- The overall conversion rate and average order value both slipped – conversion down 31.5 % and AOV down 6.9 %.
- The company still recorded a net profit of \$1,013.83, showing that the cost base did not change dramatically.

Why we can't say for certain why it happened

- The statistical engine flags the analysis with **low confidence (score 0.3)** because only 13 historical days were available, whereas 14 are required for a reliable comparison.
- Because of this limited data, the engine recommends abstaining from a definitive causal claim.
- The retrieved customer reviews do not contain any direct evidence about product availability, pricing changes, or marketing activity that could explain the sharp fall in doraemon and shinchan sales.

What could help us resolve the issue

1. **More historical data** – at least 14 days of comparable periods before and after the anomaly.
2. **Inventory and supply chain logs** – to check whether doraemon and shinchan were out of stock or had shipment delays.
3. **Marketing and promotion records** – to see if any campaigns were paused or reduced for those product lines.
4. **Price and discount history** – to confirm that no price changes occurred that might influence volume.
5. **Customer traffic sources** – to determine if traffic to product pages dropped.

With these additional data points, a more confident explanation of the revenue dip could be established.

Sales/Ops Manager

On August 9 2026 the business's revenue fell to \$1,858. The statistical engine attributes this drop mainly to a steep decline in the product "doraemon," whose sales volume dropped by 82.9 % (from a baseline average of \$228 to \$39). The next largest contributors were "shinchan" and "dragonballz," both of which also saw large volume reductions. Two non-product factors, the conversion rate (31.5 %) and the average order value (6.9 %) were also lower than the 14-day baseline.

The engine's confidence score is only 0.3, and it explicitly notes that only 13 historical days are available—one day short of the 14-day window required for a reliable comparison. Because of this, the engine recommends abstaining from drawing firm causal conclusions.

What changed

- * Volume of "doraemon" and "shinchan" orders declined sharply.
- * Conversion rate and average order value also slipped.

Uncertainty

The low confidence score reflects the limited historical data and the fact that no single factor can be confirmed as the root cause. The statistical model does not provide a reliable explanation for why the sales of these specific products and the overall conversion metrics fell.

What to investigate next

1. **Gather more days of data** – at least 14 consecutive days of sales and traffic metrics to stabilize the baseline.

2. **Check inventory and supply chain updates** for “doraemon,” “shinchan,” and “dragonballz” around the anomaly date to see if stockouts or shipping delays occurred.
3. **Review marketing activity** (promotions, ad spend) to rule out changes that might have impacted traffic or conversion.
4. **Examine customer feedback** for any patterns of complaints or issues that could explain reduced conversion or lower order values.
5. **Compare traffic sources** to see if the visitor mix changed, which could affect conversion rates.

Collecting this additional information will help determine whether the observed drops are due to supply issues, marketing shifts, or other operational factors.

Supporting Evidence

1. **2026-08-07 - review:** Decent quality for the price, would probably buy again.
2. **2026-08-09 - ticket:** Decent quality for the price, would probably buy again.
3. **2026-08-07 - review:** Great value, will be shopping here again.
4. **2026-08-09 - review:** Customer service was helpful when I had a sizing question.
5. **2026-08-12 - review:** Not bad, took a bit longer to arrive than the estimate said.
